SUBJECT: **CULTURAL RESOURCES REVIEW - 107 D/DR RETENTION BASINS
(HCRC#95-100-023)**

In response to your request of December 19, 1994, a cultural resources review was conducted for the 107 D/DR Retention Basin project, per the attached request and maps. Activities for the project include interim stabilization of the contaminated area by covering them with 18-24 inches of clean soil from borrow pit # 21. Our review indicates that your project is unlikely to disturb any cultural resources. Survey and monitoring by a cultural resource specialist is not necessary; the project may continue as planned.

Description of the activities conducted by Cultural Resources Office staff for your project are presented below:

A literature and records review of the project area was conducted by Joy Woodruff on December 20, 1994. This review indicated that the project area has not been surveyed before and that no archaeological sites have been recorded in the immediate area. This project is considered Class II: Maintenance in a Disturbed, High Sensitivity Area. Monitoring will not be required because ground disturbance in this area has been so great and deep that any archaeological deposits that may once have existed have probably been destroyed.

Although we do not believe that there are cultural resource or historic properties within the proposed project area, the workers must be directed to watch for cultural materials (eg., bone, stone tools) during all work activities. If any cultural materials are encountered as work proceeds, work in the vicinity of the discovery must stop until a cultural resource specialist has been notified, assessed the significance of the find, arranged for mitigation of the impact to the find (if necessary), and the Tribes have been notified. In this case, contact our office or Tom Marceau at 372-9201.

A copy of this memo will be sent to Dee Lloyd, A5-15, RL, as official documentation. If you have any questions, please call me at 375-9425 or Darby Stapp at 375-9441.

Please use the HCRC # above for any future correspondence concerning this project.

This guidance is based upon the description of fieldwork in your December 19, 1994 request. If any

changes occur relative to work scope or area to be impacted during activities, this office must be notified prior to beginning.

Subject: 107 D/DR ECOLOGICAL & CULTURAL REVIEWS

----- Message Contents -----

Chris,

Please initiate Ecological Review and coordinate with Joy Woodruff for the Cultural Resource Review for Interim Stabilization of the 107 D/DR Retention Basins and the adjoining surface contaminated area. The contaminated areas will be interim stabilized by covering them with 18-24 inches of clean soil. The clean soil will be obtained from Pit #21, just to the south of 100 D area. Maps have already been FAXed to you and two copies are in the Plant Mail. The TPCN for this work is PJ146.

Thanks

Bill
